Salesforce Jar Publisher

Luis Campos Guajardo, Software Engineer
Salesforce.com

About Salesforce

Salesforce is the innovative company behind the world's #1 CRM solution. Our software is cloud-based, so it doesn't require a team of IT experts to set up or manage; users just login and start using it.

The Project

As a platform, we provide multiple APIs to expose our features to customers. While we provide both [SOAP](#) and [REST](#) interfaces, a lot of customers still prefer to code using our SOAP API. In order for them to do that, we provide a [WSDL](#) file that they then use to generate a [jar](#) file that gets imported into their apps.

This project will consist of writing automation to authenticate to one of our existing public environments, download the WSDL file for a specific API, generate its jar file and publish it to a public artifact repository like Maven Central or Nexus.

Desired technologies

Core functionality: Java, Maven, Bash, XML
SCM: Git to manage the project on github.

Team Requirements

Recommended team size: 2-3 persons
Each team member would be asked to sign a NDA with Salesforce
Work can be performed anywhere, but we will at least give a tour of the Salesforce office in Louisville
Preferred communications are over email, slack and/or hangout video conferences.
