Hey guys!

As you know this pandemic has really taken us by storm. I live in LA and the people I know who have it, find it hard to keep track of their symptoms. At times, they're just too exhausted and often the exhaustion doesn't let up. Doctors are asking their patients to record symptoms every day, so if they have to go to the ER they can have as much info as possible and not be wasting important time collecting patients information. The goal of this app is to help our medical personnel, accumulate better data for the scientific community, help patients and include loved ones in the process.

Our project is a drag and drop symptom tracker "game" app. You will simply be choosing a symptom and before dropping it, you will give it a rating on intensity. We call it a game because the player will be rewarded for adding in their symptoms and we want it to have the appearance of a game. There will be a share function so they can easily update friends and family on their symptoms (loved ones care so much but it's hard to have the energy to update everyone). And a print function, so if they need to rush off to the hospital they can have it easily ready! We'd like this to be available on iOS and Android.

We would like to have ownership of the game (60/40) but will definitely be giving the team credit. Potential internship opportunity!

So coders, graphic artists,...we need all of you lol :-) We'd love to have 2-5+ students! We'll do it all through Zoom so you can be comfy at home.

We hope you'll join us! We love to hear students ideas and work together on the creative process.

Thanks,

Evie & Asha
